The biggest change in the coming years will be the recognition that georeferencing is a key element of description, retrieval, evaluation, visualization, and use in information systems of all types – not just in geographic information systems and not just associated with maps and geospatial datasets. It will be the realization that when informal georeferencing with place names is linked to formal georeferencing with coordinates or other spatial referencing systems, the result is new and powerful capabilities for information retrieval and analysis. – Linda L. Hill, Georeferencing: The Geographic Associations of Information, 2006.

Power of Distributional Records

FIGURE 1. Distribution of *Labidesthes sicculus* (blue dots) and *L. vanhyningi* (red squares) examined in this study. Stars indicate type localities.
Taken from: Werneke, D. C. and J. W. Armbruster. 2015. Silversides of the genus *Labidesthes* (Atheriniformes: Atherinopsidae). Zootaxa 4032 (5): 535-550

Evolution of Georeferencing at NCSM

Using paper maps

Using paper maps + mapping software

GEOREFERENCING

ing Calculator [4, 5], maps, ga sers, and other resources from which ordinates and spatial boundaries for places can be found. This guide is an update of eoreferencing for Dummies" [6], and explains the recommended calculation procedure fo untered in the georeferencing process.

ferences using the methods in this guide will be maximally useful if as much normation as possible is captured about and during the georeferencing process in the sllowing fields defined in the Darwin Core standard [7]. For additional community ons, see the Darwin Core Project wiki [8].

Using mapping software + established georeferencing standards

Confidence Levels

| Confidence | Description |
|------------|--|
| LO | Precise location known |
| L1 | The linear site is known to be no more than .5 mi. long. |
| L2 | The linear site is known to be no more than 1 mi. long. |
| L3 | The linear site is known to be no more than 2 mi. long. |
| L4 | The linear site is known to be no more than 6 mi. long. |
| L5 | The linear site is known to be no more than 25 mi. long. |
| L6 | The linear site does not exceed a distance equal to 1/2 the state. |
| L7 | The linear site does not exceed a distance equal to diameter of the state. |
| SO | Precise location known, plus/minus 200'. |
| S1 | Location known to be within a circle 1/4 mi. in diameter. |
| S2 | Location known to be within a circle 1/2 mi. in diameter. |
| S3 | Location known to be within a circle 1 mi. in diameter. |
| S4 | Location known to be within a circle 2 mi. in diameter. |
| S5 | Location known to be within a circle 5 mi. in diameter. |
| S6 | Location known to be within a circle 15 mi. in diameter. |
| S7 | Location known to be within a county. |
| S8 | Location known to be within 1/2 of the state. |
| S9 | Location known to be within the state. |
| S10 | Location unknown. |
| | |

The Confidence Levels were taken from the Scale of Relative Certainty (with slight modifications) which was written by Dr. Eric H. Metzler and published in the Association of Systematics Collections October 1994/ vol. 22 no. 5 newsletter. VNIVERSALE DESCRITTIONE DI TVITA LA TERRA CONOSCIVTA FIN QVI
