

What can TORCH glean from the history, development and challenges of another regional herbarium network?

August 13, 2016

Sponsored by Appalachian State University, iDigBio and the
National Science Foundation

SERNEC: SouthEast Regional Network of Expertise and Collections

National Science Foundation
Research Coordination Network
RCN Award # 0542320

National Science Foundation
Advancing Digitization of
Biological Collections
Award # 1410069

Issues to address:

The Hook

History

Foundation

Structure

Organization

Sustainability

The Hook?

Southeast USA: A biodiverse region with extensive natural areas preserved

Source: Precious Heritage (2000) © TNC, NatureServe

Why: Rich tradition of historical biogeographic study & collecting $\therefore$ potential to forecast future distributions

FIGURE 9. Migration of beech.

Why are the Southern Appalachian Mountains Important?

1. Oldest landmass in eastern North America
2. Unaffected by marine waters or continental glaciation
3. Source of inoculum for the glaciated north and refugia for more southern species
4. High elevation north-facing terrain provides habitat for several northern disjunct taxa

Source: SAMAB (sunsite.utk.edu/samab/Region/region.html)

What are our challenges?

- Climate change
- Species extinction
- Population growth
- A need for a renewed Green Revolution to address issues of food, health and the environment

National Research Council Committee on a ‘New Biology’ for the 21st Century

New approach that “depends on greater integration within biology, and closer collaboration with physical, computational, and earth scientists, mathematicians and engineers ---

be used to find solutions to four key societal needs:

1. sustainable food production
2. ecosystem restoration
3. optimized biofuel production
4. improvement in human health

Coordinated effort to leverage resources across the federal, private and academic sectors to meet these challenges.

SPUDCOMICS.COM

© 2011 LONNIE EASTERLING

WHY ALL THE KING'S HORSES WERE USELESS

How can we address this challenge?

We need to work at a scale and scope that can address global issues.

Regions with effective number of collections.

Regions with appropriate expertise.

History

2020 Vision: Implementing a community approach to getting herbarium collections databased and online.

- In 2004, an NSF-supported workshop to gather 25 curators from the U.S. at Michigan State to discuss the future of herbarium collections
- A decision was made to write a proposal for an NSF RCN.

- 2005 NSF Research Coordination Network (RCN) awarded to build the 'human infrastructure' to begin the '2020 Vision effort'
- 5-year project
- 150 herbaria participated
- Used existing infrastructure of the Association of Southeastern Biologists

The Key to the Cabinets: Building and Sustaining a Research Database for a Global Biodiversity Hotspot

A new NSF-Advancing Digitization in Biological Collections (ADBC) collaborative project in the southeast

NSF ADBC #1410069 (plus collaborative awards

HERBARIUM
UNIVERSITY OF WISCONSIN - GREEN BAY

Carya cordiformis (Wangenh.) K.Koch Juglandaceae

Marinette County, Wisconsin. Town of Silver Cliff
Latitude: N45.24356 longitude: W87.64753

Growing in a young upland forest of mostly *Acer saccharum* with *Tilia americana*, *Fraxinus americana*, *Ostrya virginiana* and a few *Tsuga canadensis*. The understory is largely comprised of saplings of *Acer saccharum* and a few *Cornus alternifolia* and *Ostrya virginiana*. Ground layer species include *Trillium grandiflorum*, *Caulophyllum thalictroides*, *Allium tricoccum*, *Carex pedunculata*, *Carex arctata* and *Schizachne purpurascens*. A few trees of *Carya cordiformis* were found, the largest to about 8 inches diameter and no seedlings were observed.

14 May 1977

Foundation

Networks and collaborations on this scale do not develop overnight

The potential success of this network is rooted in the significant contributions made by biologists in the region over the past century that provide a solid foundation for this effort. Meeting annually for the past 60 years.

The Association of Southeastern Biologists (ASB)

The Southern Appalachian Botanical Society (SABS)

How can we identify “natural” groups?

Associations and journals, annual gatherings, taxon based societies.

constitution structure

Society of Herbarium Curators
Uniting Herbaria Across the Nation and Around the World

User Login	The Society for Herbarium Curators	The Curator's Toolbox
Click Here to Login! Logout	The Society of Herbarium Curators (SHC) is a forum for discussion, action and support for herbaria. The SHC is an umbrella organization aiming to unite herbaria across the nation and around the world. The purpose of the society shall be to promote and expand the role of herbaria in botanical research, teaching, and service to the community at large, to provide a forum for discussion and action on all issues confronting herbaria, and to extend its efforts and interject its influence toward the protection and preservation of endangered herbaria. The Society publishes an annual newsletter, <i>The Vasculum</i>, and is closely affiliated with the SouthEast Regional Network of Expertise and Collections (SERNEC). WHAT IS A HERBARIUM? 	1. Creating a Virtual Herbarium 2. Specimen Identification Services 3. How to Package Specimens 4. Herbarium Issues-Insecticides 5. Links to Herbaria Curation Methods 6. Herbarium Networks and Other Digital Herbaria 7. How to Make Interactive Keys 8. Collaborative Mapping Projects 9. Other Resources

<http://www.societyofherbariumcurators.org/>

SERNEC Business plan

- Use state or sub-region level groups to seek funding for digitization.
- Expedite information exchange among state consortia for ideas on education and outreach.
- Develop distributed network of IT support that could be shared by the total network.

Structure

Information science

an interdisciplinary field primarily concerned with analysis, collection, classification, manipulation, storage, retrieval and dissemination of information

Cyberinfrastructure

A combination of databases, network protocols and computational services that brings people, information and computational tools together to perform science in this information-driven world.

Lincoln D. Stein

www.nature.com/reviews/genetics

Appalachian
STATE UNIVERSITY

Cyberinfrastructure

Data infrastructure and storage

Computational infrastructure

Communication infrastructure

Low-level (connectivity and bandwidth)

Syntactic (common formats to organize data)

Semantic (common terminology/ontology)

Human infrastructure

Sharing and curation

Current biology cyberinfrastructure

- Strong data infrastructure (data are out there, but hard to find)
- Weak computational grid (lack of integration, need programming skills to access information)
- Patchy syntactic and semantic connectivity (standards to describe data)
- Strengthening human infrastructure

Stein 2008 www.nature.com

Building a regional cyberinfrastructure:

To bring people, information and computational tools together to provide opportunities for cooperation, collaboration and communication.

Merging content curation and
content creation communities:

A model system using the herbarium
community

P.I. Andrew Sallans, University of Virginia

Co. P.I. Michael Denslow, NEON

& Zack Murrell, Appalachian State University

Cyberinfrastructure

- Data infrastructure and storage
- Computational infrastructure
- Communication infrastructure
 - Low-level (connectivity and bandwidth)
 - Syntactic (common formats to organize data)
 - Semantic (common terminology/ontology)
- Human infrastructure
 - Sharing and curation

Lincoln D. Stein

www.nature.com/reviews/genetics

Data infrastructure and Storage

- Network of databases
- New information from automatic acquisition and direct submission
- Researchers access through web-based front end
- Examples: PubMed, Ensembl, Kyoto Encyclopedia of Genes and Genomes (KEGG)

Current projects

- Centralized online databases (GenBank, IniProt, Protein Data Bank)
- Community Annotation Hubs (open database to direct contribution from the community, e.g. Flickr, Morphbank, many WIKI based, such as EcoliWiki)
- Bioinformatics toolkits (serve discrete communities, e.g. Generic Model Organism Database)

Cyberinfrastructure

- Data infrastructure and storage
- Computational infrastructure
- Communication infrastructure

Low-level (connectivity and bandwidth)

Syntactic (common formats to organize data)

Semantic (common terminology/ontology)

- Human infrastructure

About

TeraGrid is an open scientific discovery infrastructure combining leadership class resources at eleven partner sites to create an integrated, persistent computational resource.

Using high-performance network connections, the TeraGrid integrates high-performance computers, data resources and tools, and high-end experimental facilities around the country. Currently, TeraGrid resources include more than a petaflop of computing capability and more than 30 petabytes of online and archival data storage, with rapid access and retrieval over high-performance networks. Researchers can also access more than 100 discipline-specific databases. With this combination of resources, the TeraGrid is the world's largest, most comprehensive distributed cyberinfrastructure for open scientific research.

TeraGrid is coordinated through the Grid Infrastructure Group (GIG) at the University of Chicago, working in partnership with the Resource Provider sites: Indiana University, the Louisiana Optical Network Initiative, National Center for Supercomputing Applications, the National Institute for Computational Sciences, Oak Ridge National Laboratory, Pittsburgh Supercomputing Center, Purdue University, San Diego Supercomputer Center, Texas Advanced Computing Center, and University of Chicago/Argonne National Laboratory, and the National Center for Atmospheric Research.

The TeraGrid project is funded by the [National Science Foundation](#) and includes 11 partners: [Indiana](#), [LONI](#), [NCAR](#), [NCSA](#), [NICS](#), [ORNL](#), [PSC](#), [Purdue](#), [SDSC](#), [TACC](#) and [UC/ANL](#).

Please email help@teragrid.org with questions or comments or fill out the online [feedback form](#).

Welcome to Biodiversity Information Standards (TDWG)

Biodiversity Information Standards (TDWG) is an international not-for-profit group that develops standards and protocols for sharing biodiversity data. [Read more.](#)

TDWG 2009 - Montpellier France

e-Knowledge about biodiversity and agriculture

TDWG 2009 will be held in Montpellier, France from **Monday November 9 until Friday November 13.**

The meeting will be hosted by Agropolis and Bioversity International at Le Corum in central Montpellier.

Details about the conference are available from the [MAIN CONFERENCE PAGE](#).

The conference will include both plenary and theme-based working group sessions, poster display, computer demonstrations and tutorials. If possible, additional time for working group sessions may be able to be arranged.

53 Biodiversity Informatics Network Databases

TDWG Architecture Standards

Architecture is a Three Legged Stool

Leg 1: Ontology

- Defines object types and their properties
- Formal Naming of commonly used types-of-things
- Only for types-of-things in our domain
- Like Dublin Core metadata

- Ontology is for exchange only
- Does not model the whole domain

Leg 2: Protocols

- TDWG Access Protocol for Information Retrieval (TAPIR)
- Remote users can issue SQL-like requests
- Designed to serve to multiple networks
- KML for Google Earth, or RSS for a news feed possible

- Architecture not bound to TAPIR
- OAI-PMH, SPARQL or other

Leg 3: Globally Unique Identifiers

species link

- Same record twice?
- How do we track provenance?
- How do we integrate objects that refer to the same thing?
- LSID chosen technology

- Architecture not bound to LSID
- Other GUIDs are available

lsid Life
Science
Identifier
resolution project

Here are a few examples of **LSIDs**:

- <urn:lsid:ipni.org:names:30000959-2> - A plant scientific name from [IPNI](#)
- <urn:lsid:ubio.org:namebank:11815> - A scientific name from [UBio](#)
- <urn:lsid:ubio.org:classificationbank:1164063> - The description of a genus also from [UBio](#)
- <urn:lsid:indexfungorum.org:Names:213649> - A scientific name of a fungi from [Index Fungorum](#)
- <urn:lsid:gdb.org:GenomicSegment:GDB132938> - A segment of the human genome from [GDB](#)

LSID: a way to name and locate information on the Web

What does an LSID look like?

[Go](#)

LSIDs are Universal Resource Names (URN) that conform to the following syntax:

15,324,063

Specimen Records

2,342,880

Media Records

255

Recordsets

SEINET – REGIONAL NETWORKS OF NORTH AMERICAN HERBARIA

The SEINet North American plant network was the first Symbiota-based project to be configured as a fully integrated portal network. SEINet currently features 10 regional North American portals, each of which represents a unique perspective or research community. Data from all projects within the network are configured to access a single shared database. Given this configuration, an herbarium from the Midwest consortium (<http://midwestherbaria.org>), such as the Field Museum, can enter one of their specimens that was collected within Sonora, Mexico and the data would simultaneously be available within the North Mexico consortium portal (<http://herbanwmex.net>). This configuration gives the regional communities control over their portal identity without sacrificing the benefits of participating in a collaborative data network.

Private collections

State of Herbaria in the Southeast USA

- 233 collections vary in size from 3,000 to 750,000 specimens.
- Curators are taxonomists, ecologists, paleobotanists, population biologists.
- Some institutions with significant budgets, IT support and curatorial staff.
- Some institutions are single person operations without budgets or IT support.
- ESTIMATED 15 MILLION SPECIMENS FROM THE SOUTHEAST.

Data derived from Index Herbariorum (<http://www.nybg.org/bsci/ih/ih.html>) .

**Extend to “affiliates”
and citizen scientists**

What are the ADBC project goals?

Use our robust human infrastructure

- 1) improve protocols at every stage of specimen digitization.
- 2) interface with citizen scientists to develop a strong collaborative community that will sustain high transcription and georeferencing rates through a multi-year effort.

Showing 1 to 8 of 8 records

Efforts to date:

1. 106 herbaria involved (Goal = 93)
2. Data pipeline completely functional
3. 1,7M specimens imaged (Goal = 4,5M)
4. 200+ students trained
5. 0,5M specimens transcribed
6. 50+ abstracts and publications
7. Multiple symposia and workshops

How do we sustain this effort?

**Selfish and contentious people will not cohere,
and without coherence nothing can be
effected.**

Charles Darwin Descent of Man. 1871

"As access to information dramatically expands, so that people increasingly have access to almost all the information they might need at any time and in any place (and, surprisingly, at low or no cost), the value of the cognitive skills still unreplicable by silicon becomes greater."

What works?

1. Use existing infrastructures (Association of Southeastern Biologists).
2. Provide a reward system of making the group's aggregated data available for their own manipulation.
3. Transformational leadership.
4. Engaging students in the classroom and in research.
5. Effective communication.

Ethics of Citizen Science

- Collaborators - not users
- Contribute to real research
- Don't waste people's time

Arfon Smith (2013)

Governance structure based on the Society of Herbarium Curators constitution

Regional chapter of SHC

Decision-making
Consensus building
Conflict resolution
Knowledge transfer
Longevity
Sustainability

What are the long term
challenges to
sustainability?

Long term challenges

- 15M specimens available
- Data storage: local or regional
- Data attribution: credit for work
- Expansion into new projects
- Maintain system as “best practice” for the community
