Values of defined workflows

- Promote efficiency and automation of processes
- Facilitate routing and scheduling of activities
- Provide for balancing workloads
- Ensure that processes are visible and predictable
- Allow for escalations and notifications
- Enhance tracking of tasks
- Foster collaboration of all parties involved
- Stimulate the convergence of process and information
- Promote continuous evaluation and redesign

Implementation in
Tracks to Digitization

• **Taking the inside track** is often based on stretching the institution’s resources. Decisions are made to maximize resources available for user-initiated digitization by using solid baseline practices. The primary focus on the inside track is to get the job done quickly and to fill the user’s request.

• **Taking the middle track** has the widest range of options, standards, and results. This is the most flexible of the tracks, where decisions often fall in gray areas.

• **Taking the outside track** focuses on the collections themselves. While users may initiate digitization, it is undertaken to deliver materials to a greater public. These decisions may lead to comprehensive digitization, such as an entire book, series, or collection. The goal is to create maximum access to special collections, using preservation and archival standards. This track usually involves a level of thought and planning that is more in-depth than the fulfillment of day-to-day digitization requests.
Pressures mitigating the long view

So much data, so little time.
Our collections are not getting smaller.
The funding agencies have high output expectations.
We only have 3 years to get this done.
All of our data and all of our specimens are important.
Let’s just use the images!
We’ll do the minimum now and enhance it later.

Taking the long view means developing doable, effective, and sustainable strategies for balancing long term goals with short term constraints, including a commitment to implementing future enhancements.
Global Digitization Continua

Current Tools → Potential Future Tools

Fitness → Quantity

High cost/specimen → Low cost/specimen

Efficiency → Speed

Digital protocols → Traditional practices

Image everything → Image exemplars → Image nothing

Ancillary materials → Specimens only

Evolving workflows → Static workflows
### Example Processes (Modules), their Cycles and Dependencies

Follow a modular approach
• “Plug and play” modules are preferred.
• Simple modules involving a limited number of tasks are easier to troubleshoot and maintain.
• Divide large modules into sub-modules.
• Modules are generally self-contained but tangential.
• There is no consensus workflow, virtually all workflows are customized.

Assign roles deliberately
• Adjust to strengths of each technician--using students and volunteers requires flexibility in role assigned to personnel rather personnel assigned to role.

Create task lists
• Complete.
• Clear.
• Succinct.
• Ordered.
• Reusable.
Documentation and Instructions

- **Written Protocols**
  - Essential!
  - Include screen shots and pictures.
  - Attention to detail (leave nothing to the imagination).
  - Express limits on technician authority.

- **Feedback Loops**
  - Technicians: best source of efficiency adaptations, either by show or tell.
  - Easy methods for receiving feedback.
  - Personal copies of the protocol.
  - Master copy available via Google docs or other shared storage for updates and suggestions.
Continuous Workflow Improvement

Develop written workflows that reflect actual practice

Continuous evaluation of written and actual workflows by:
- Technicians
- Workflow managers
- Collections managers

With particular attention to:
- Bottlenecks
- Redundancy
- Handling time
- Varying rates of productivity
Digitization workflows for paleontology collections

Talia S. Karim, Roger Burkhalter, Una C. Farrell, Ann Molineux, Gil Nelson, Jessica Utrup, and Susan H. Butts

ABSTRACT

The development of digitization workflows is an essential part of any formalized large-scale digitization program. Paleontological collections literature has addressed the need for, and utility of, digitized collections for nearly four decades, but no modern, community-vetted set of digitization workflows to accomplish this goal has been widely adopted. With the advent of the U.S. National Science Foundation’s (NSF) Advancing the Digitization of Biodiversity Collections (ADBC) program in 2011, iDigBio, NSF’s national coordinating center for facilitating digitization, in collaboration with broad community representation from numerous institutions, launched a series of working groups to address workflow development across all major preparation types. Workflow modules have been developed for pre-digitization curation, data entry, imaging objects (catalogs, field notes and other materials not stored with specimens, labels, two- and three-dimensionally preserved specimens), image processing, and proactive digitization. Modules and the tasks they include may be implemented in any order and customized for specific configurations and institutional parameters. The workflows are made publicly available for download and customization at GitHub and via the iDigBio documentation pages. A review of platforms for electronic data publishing through online aggregators, a crucial step in any digitization program, is also provided.
Workflow Modules

Module 0: Pre-Digitization Curation
Module 1: Data Entry
Module 2: Imaging
  Module 2A: Imaging catalogs, field notes, and other materials not stored with specimens
  Module 2B: Imaging labels associated with specimens
  Module 2C: Imaging three-dimensionally preserved specimens
  Module 2D: Imaging two-dimensionally compressed specimens
  Module 2E: Image processing
Module 3: Proactive Digitization

Module 0: Pre-Digitization Curation and Setup
